Licensed Psychologist- doctorate
Stress

- **Positive Stress:** moderate, brief, and generally a normal part of life (e.g. entering a new childcare setting).

- **Tolerable Stress:** events that have the potential to alter the developing brain negatively, but which occur infrequently and give the brain time to recover (i.e. the death of a loved one).

- **Toxic Stress:** strong, frequent, and prolonged activation of the body’s stress response system (e.g. chronic neglect).
Resilience is “the capacity for adapting successfully and functioning competently, despite experiencing chronic stress or adversity following exposure to prolonged or severe trauma.”

Protective Factors:
- At least one stable, caring, and supportive relationship.
- Achieving a sense of mastery over one’s life circumstances.
- Supportive context: Affirming faith or cultural traditions.
- Executive functioning and self-regulation skills:
  - The ability to focus attention
  - Problem-solving
  - Future planning
  - Adaptability
  - Self-regulation
  - Impulse Control

(National Scientific Council on the Developing Child, Center on the Developing Child at Harvard University, 2015)

Joelle van Lent, Psy.D.
Over time, the cumulative impact of positive life experiences and coping skills can shift the fulcrum’s position, making it easier to achieve positive outcomes.

(National Scientific Council on the Developing Child, Center on the Developing Child at Harvard University, 2015)
Trauma: A Shared Definition

Individual trauma results from an EVENT, series of events, or set of circumstances that is EXPERIENCED by an individual as physically or emotionally harmful or life threatening and that has lasting adverse EFFECTS on the individual’s functioning and mental, physical, social, emotional, or spiritual well-being.

(SAMHSA’s Trauma and Justice Strategic Initiative, July 2014)
Developmental or Complex Trauma

• Chronic and ongoing exposure to abuse, neglect, and/or a chaotic environment within the first days, months, or years of life.

• The source or perpetrator(s) of the trauma are primary caregivers.

• The impact is both immediate and long-term. The child’s development is impacted across all domains (i.e. relational, neurological, behavioral, cognitive, and in identity-formation).

• An effective approach to intervention will need to be comprehensive, coordinated, and developmentally sensitive.

Resilience
Protective Factors & Essential Skills

- Social Support
- Social Competency
- Emotional Regulation
- Executive Functioning Skills

Joelle van Lent, Psy.D.
The Healthy Attachment Sequence

Physical or psychological need

Relaxation

Security
Trust
Attachment
Self-regulation
Object constancy

Attunement/satisfaction of need

State of high arousal

(Beverly James)

Joelle van Lent, Psy.D.
Unhealthy Attachment

Physical or psychological need

Shame
Mistrust
Dysregulation
Disturbed “mental blueprint”

Anxiety
Rage
Numbing

Needs are disregarded/attunement disrupted

State of high arousal

(Beverly James)
Improving Social Competence

- Perspective-taking.
- Initiating and sustaining a social interaction.
- Accurately reading and responding to nonverbal cues.
- Problem-solving & benefitting from natural consequences.
- Accepting praise & encouragement.
- Creating a positive social interaction & experiencing interactions as positive.
- Making choices that will lead to people having positive feelings about him/her.
- Increasing his/her sense of belonging & the belief that he/she can contribute to the group in a positive way.
Co-Regulation
From Allan Schore
( Pat Ogden)

Auto regulation is the ability to self regulate alone without other people. It is the ability to calm oneself down when arousal rises to the upper limits of the window of tolerance and also to stimulate oneself when arousal drops to the lower limits.

Interactive (psychobiological) regulation involves the ability to utilize relationships to mitigate breaches in the window of tolerance, and to stimulate or calm oneself.

Joelle van Lent, Psy.D.
Key Facts

• The brain develops through experience.

• The brain develops sequentially from the base up.

• 80% of the brain is developed by approximately age 3.

• The remaining brain development occurs through to early adulthood.

• There are sensitive or critical times for development of specific achievements—enrichment at those times is essential.

• Experiences that occur early on have a greater impact on the way the brain forms and functions than those that occur later in life.

The brain’s **ability to change** in response to experiences

The **amount of effort** such change requires

**AGE**

2 4 6 8 10 20 30 40 50 60 70

**SOURCE: LEVITT (2009)**
A Trauma Trigger

- Cues or signals that act as a sign of possible danger, based on traumatic experiences, leading to a set of responses oriented toward survival.

- The responses can be emotional, physiological or behavioral.

- The interpretation and response is determined by the perception, beliefs, and assumptions of the individual more so than the “reality” of the situation.

Joelle van Lent, Psy.D.
Key themes

• Intentional use of language (separate behavior from character)

• A stance of curiosity

• Reinforce what is working & replace undesired behaviors

• Help children understand why what they are doing is working with more depth & help generalize that learning

• Instill a sense of agency, control & competency

• Tell the truth

• Less talking - more doing
